About Me

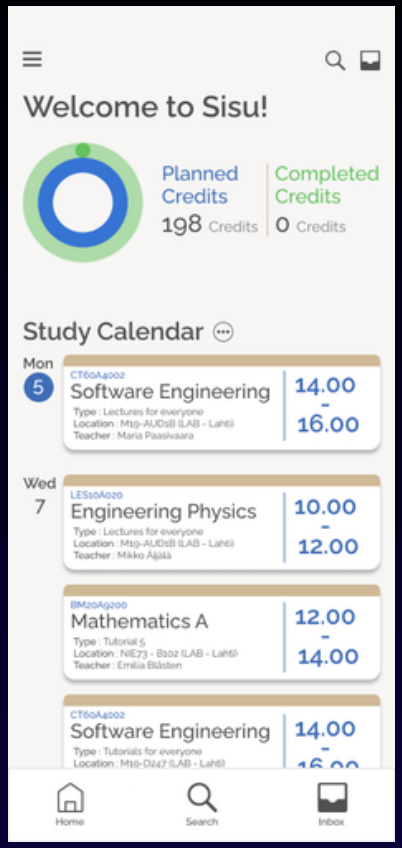
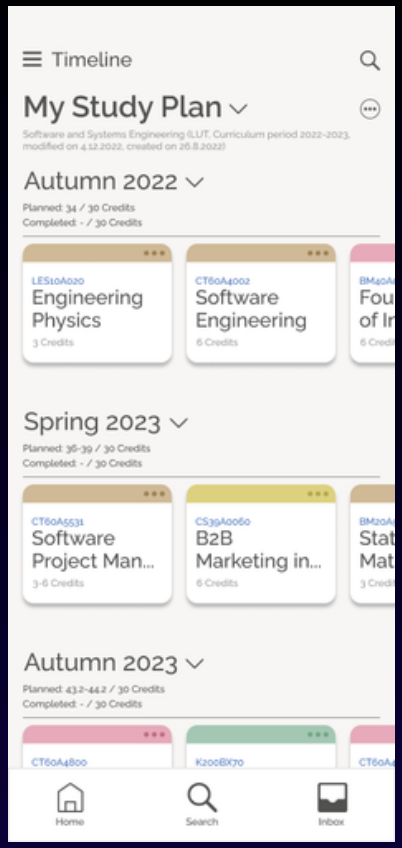
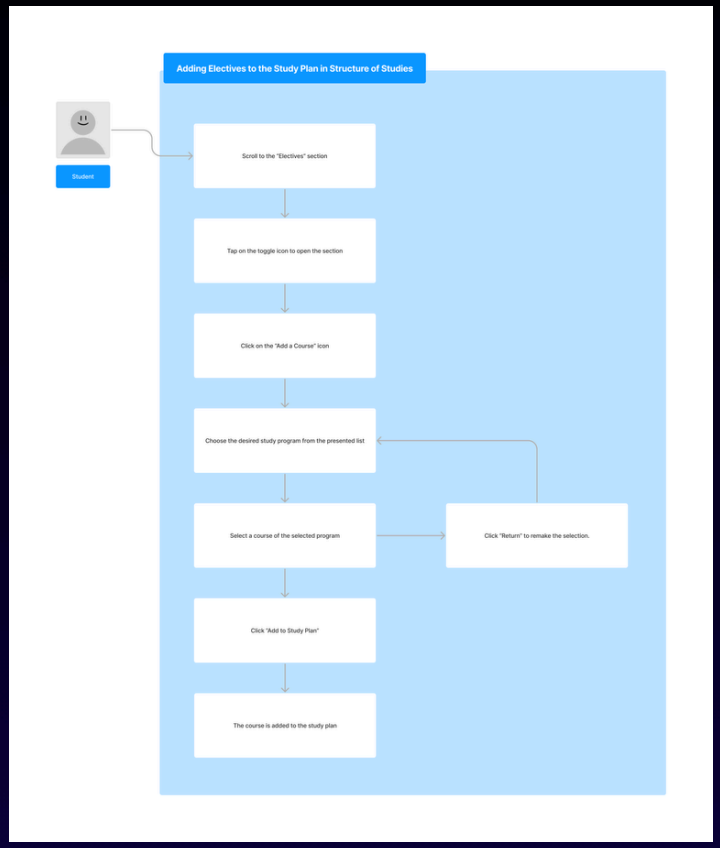
Hello, my name is Suthinee Segkhoonthod. I am currently completing my Master's studies in Human-Technology Interaction (HTI) at Tampere University. From a very young age, I have been creating and expressing my creativity and ideas through various design mediums: illustrations, graphic design, editorial design, photography, and fiber arts. I believe that through design, one can influence and shape people's perspectives — and actions — in ways that lead to meaningful social contributions. Inspired to develop creative, ethical products that centralize people's needs, I actively partake in projects that involve both technical and design disciplines. In this portfolio, I have included projects in wireframe and user interface design, game design and development, graphic design, and editorial design.







Sisu (Mobile Application Version)

Overview

The mobile application version of Sisu

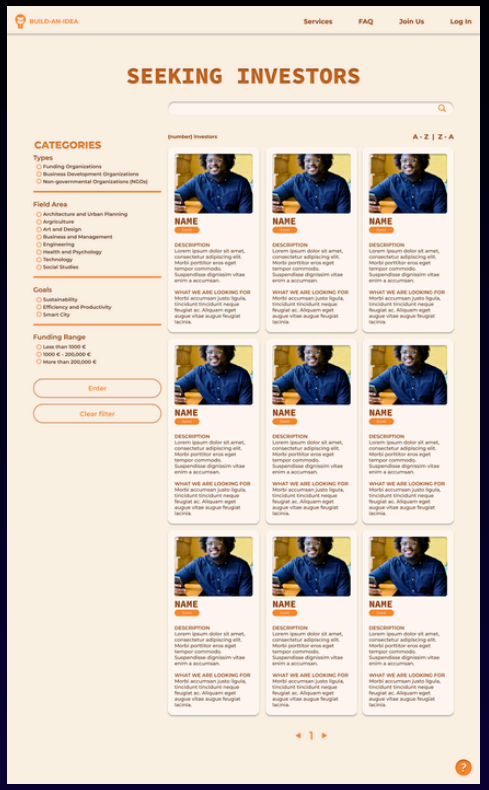
To understand the steps of software development cycle, my teammates and I developed the mobile application version of Sisu: a platform where students modify their study plans, enroll in courses, and view their class timetables. I visualized the user journey through use cases. The displayed use case details actions taken by the user adding an elective course to their Personal Study Plan (PSP) on the "Structure of Studies" page. This allowed me to develop guidelines for wireframe and user interface design on Figma. To create a comfortable and familiar atmosphere, I primarily incorporated Sisu's colors and Raleway font. In addition to referencing Sisu's 2022 website UI design, I also incorporated elements from email and calendar mobile applications.To ensure the mobile application contains features of Sisu, I supplemented two navigation bars: the bottom navigation bar guides user to the Home, Search, and Inbox, while the upper left to Structure of Studies, Timeline, Registration, Study Calendar, Profile, and Help.

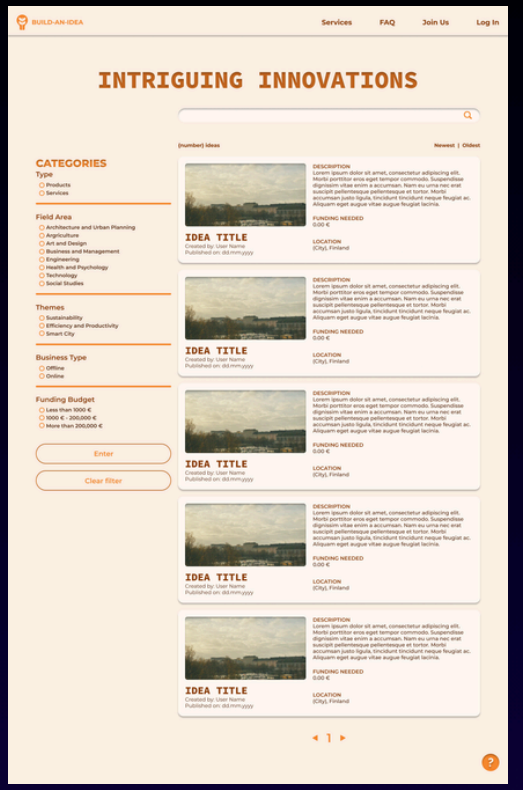
Build-An-Idea

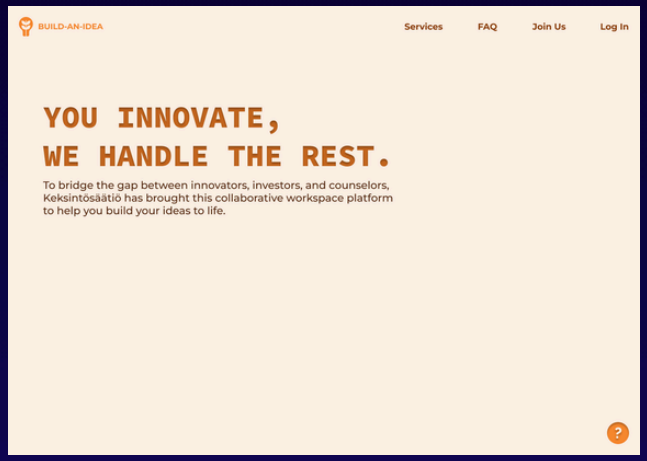
Overview

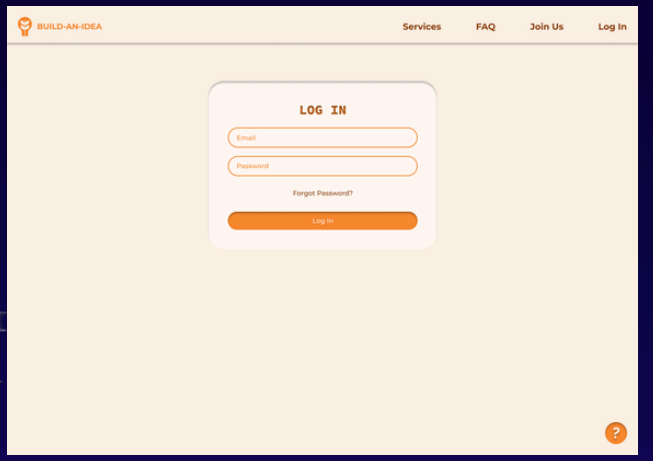
A website that answers the needs of three different user groups

As part of Junction 2022, my teammate and I developed Build-An-Idea, a comprehensive website with versatile functionalities aimed at resolving the needs of three different user groups: innovators seeking funding, investors seeking startups, and experts providing guidance. With the vision to create an inclusive atmosphere, I researched on color theory, and selected a primary palette of orange and adjacent colors, which are associated with warmth and community. In addition, I selected the Montserrat font to ensure a modern, professional look and high readability. I also illustrated the website's logo on Adobe Illustrator, combining a light bulb with a growing plant to signify that these budding innovations are in need of support and guidance. Once the foundation guidelines were finalized, I designed the website's wireframe and user journey on Figma.







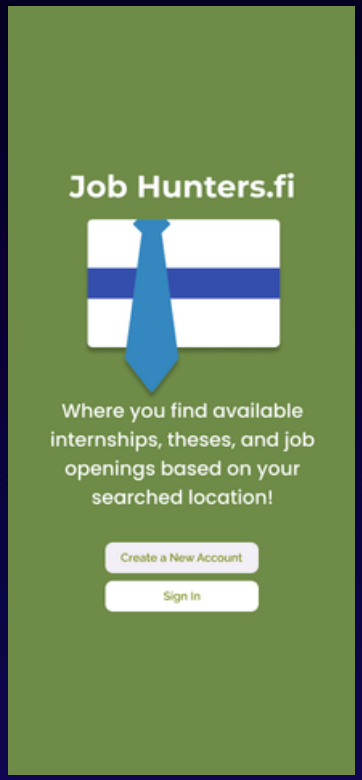


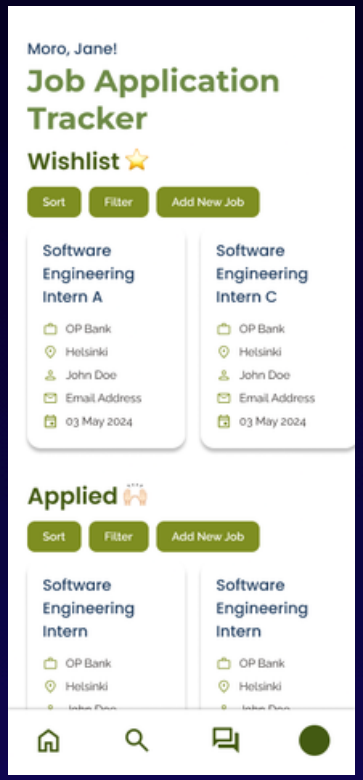
JobHunters.fi

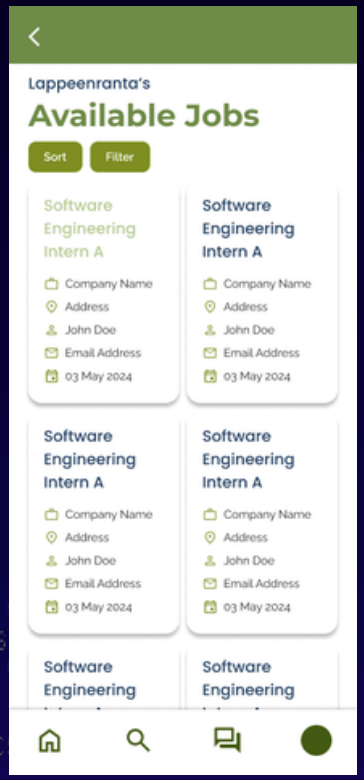
Overview

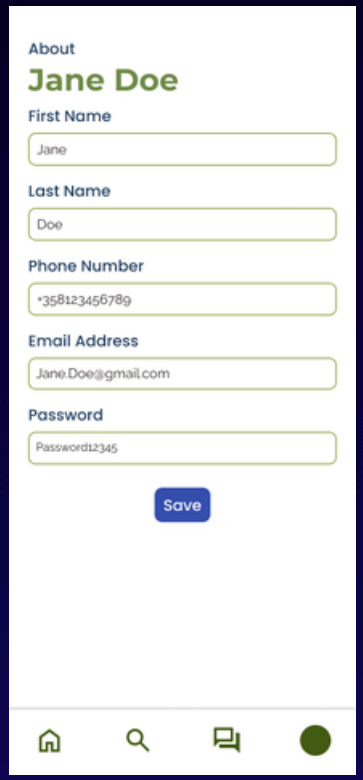
A location-based job tracking mobile application developed on Android Studio

For a course requiring a Java-based mobile application in Android Studio that fetches API data, I developed JobHunters.fi: a location-based job tracking application for users searching for open positions in Finland. With a vision to create a calming and community-oriented atmosphere, I incorporated community thread features similar to Reddit's forums. Once the main features, racking applications, searching for jobs, and messaging other users, were finalized, I moved forward with establishing the design baseline. Since the application is targeted at individuals living in Finland, I selected colors associated with the Finnish landscape: green, blue, and white. I used the Raleway font to foster a sense of community while ensuring readability. To further emphasize the purpose of the application, I designed the application's logo on Adobe Illustrator, featuring the Finnish flag and a necktie. Finally, I detailed the user journey through multiple wireframes that showcased UI changes, such as when a user searches for jobs in Lappeenranta, which served as the foundation for the application's development.







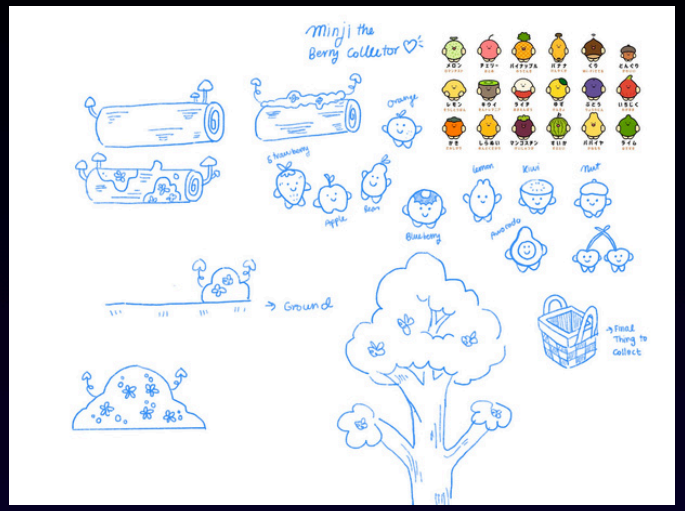


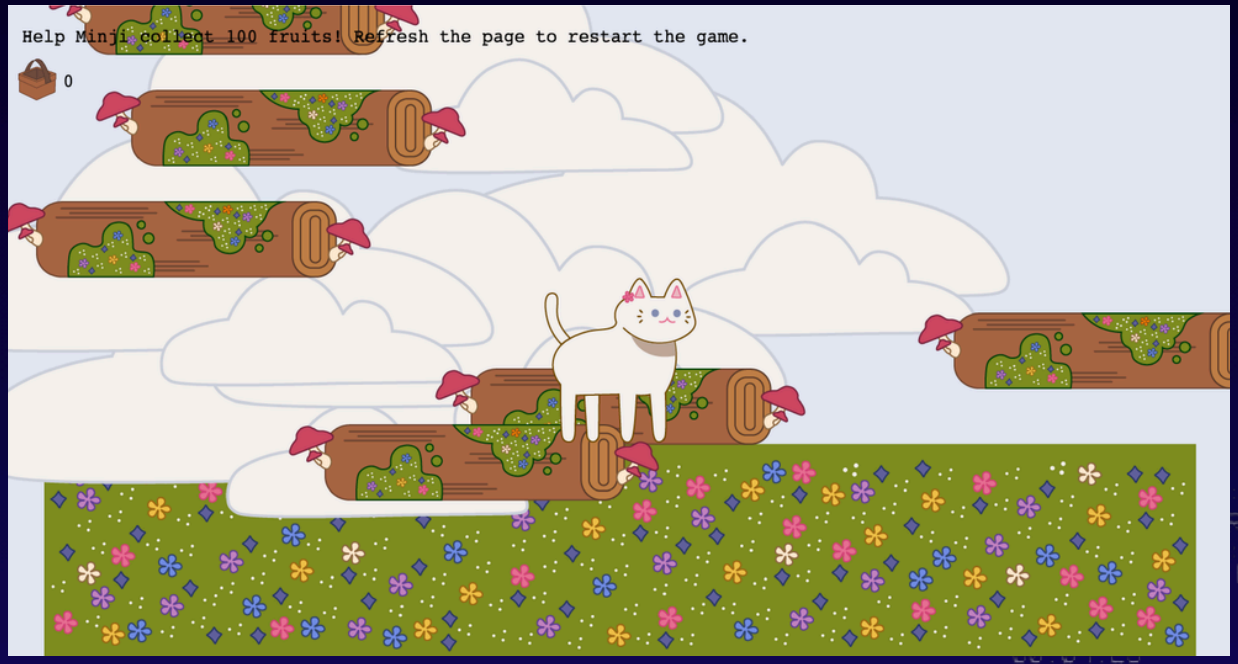
Minji the Fruit Collector

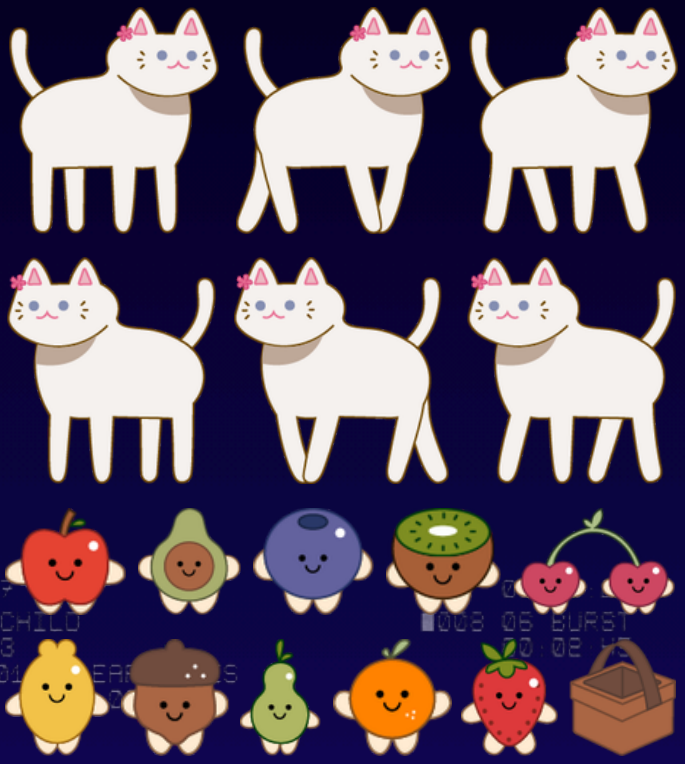
Overview

A simple jumping game where the user, as Minji, must collect 100 fruits to complete the game

I conceptualized and developed a simple jumping game using JavaScript, HTML, and CSS. Drawing from my nostalgia for mobile games where a character must jump upwards to complete tasks, I finalized the concept of Minji the cat collecting fruits. To provide a fun environment for the user, I first sketched the initial character designs on Procreate. Once satisfied, I created the necessary images for Minji's movements on Adobe Illustrator to produce sprite actions for walking and jumping in both directions. I also illustrated the fruits and interactive background elements. Finally, I coded the game on VS Code in JavaScript, writing the sprite animations, the point counter, and the game asset loader.





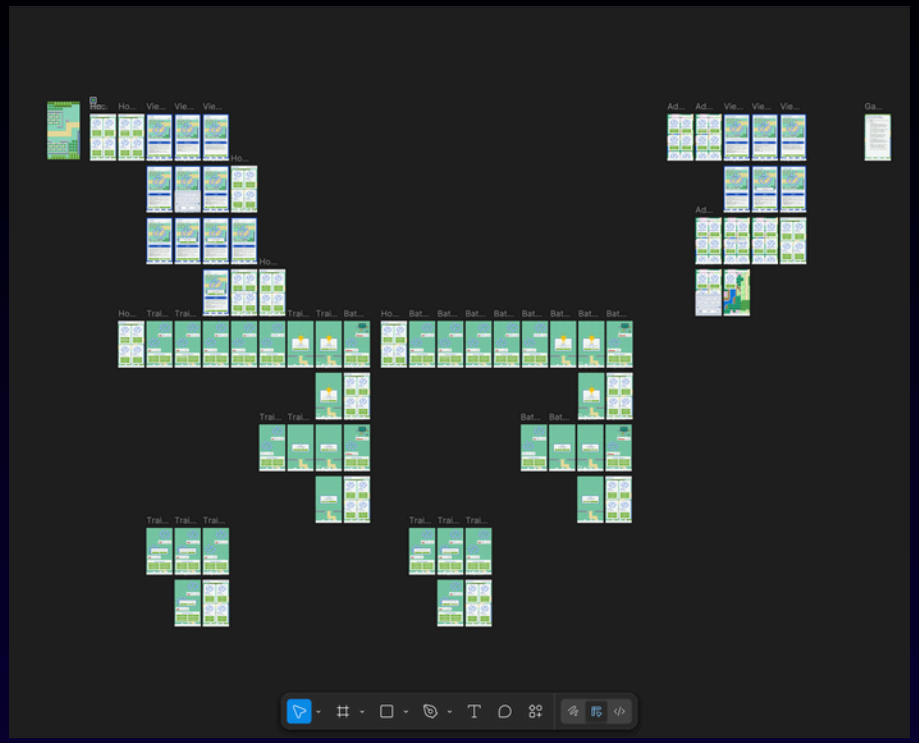


Lutemons: Battle Out!

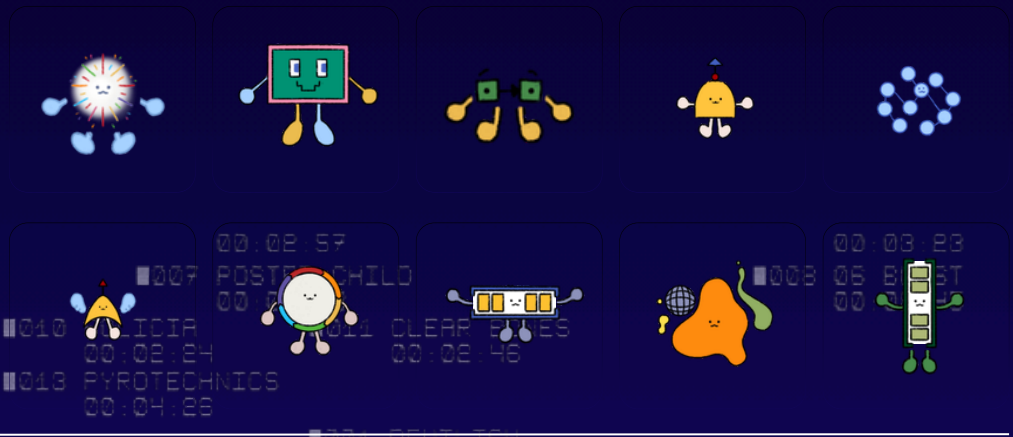
Overview

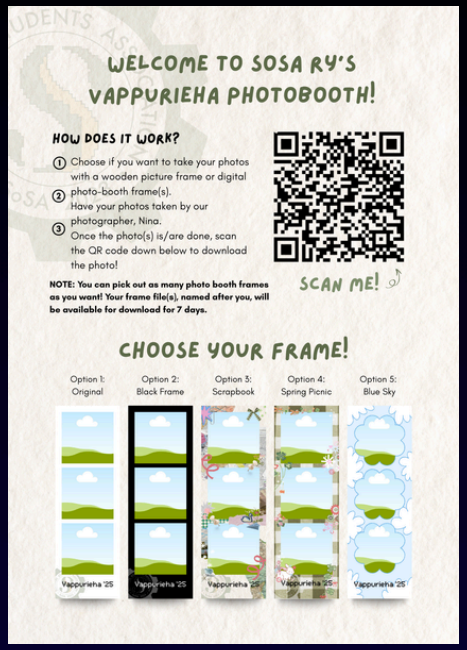
A "Pokemons: Go" inspired mobile game application developed on Android Studio

For a Java programming course, my teammate and I designed a mobile game application in Android Studio inspired by "Pokémon GO." I conceptualized ten game characters based on the software engineering, energy technology, and industrial engineering subjects offered at LUT University. I sketched and finalized these characters on Procreate, developing their powers, weaknesses, and special abilities based on their academic fields. To create a functional game within time constraints, we wrote clear gameplay guidelines to serve as a baseline for the app's functions. I then designed the wireframes and user interface on Figma, detailing how the screen changes when a user interacts with specific features, such as editing the name of a collected Lutemon. This visual mapping enabled us to focus our development efforts on the most significant features of the application.



Characters (from left to right):
First Row: Energy; HTML; Linked List; AND Logic Gate; network Topology
Second Row: OR Logic Gate; Product Development Cycle (PDC); Queue; SolidWorks; Stack





SoSA ry Vappurieha Photobooth

SoSA ry participated in Vappurieha, a city-wide event in Lahti celebrating Labor Day (Vappu). Since the event targeted families and children, we created an interactive physical photobooth where we took photos for customers and provided them with digital copies via a QR code. I designed the promotional poster, which included instructions, the download link, and various frame options for the customers. To minimize language barriers, I created the poster in both English and Finnish. Since the event celebrates the arrival of spring, I designed the frames using color palettes that evoke family fun and the spring season.

SoSA Software Meetup

SoSA ry organized a networking seminar in October 2025 aimed at helping members gain insight into the software industry and the working lifestyle in Finland. I designed the marketing materials on Canva, including critical information such as the event name, promotional tagline, venue, and time. With the event featuring guest speakers from Kempower and Virnex, I included their company logos to communicate to our members that these professional organizations would be present at the seminar.

SoSA ry 2026 Officer Application

To encourage members to join the student community and support the board of directors, I designed the 2026 Officer Application materials on Canva. My goal was to create a sense of belonging and showcase the active student community within SoSA ry. To achieve this, I primarily used group-oriented photos featuring our current association members, highlighting the collaborative spirit of the organization.

FGJ LUT Lahti

Overview
A game development hackathon organized by SoSA ry from 24-26 January 2025

From January 24–26, 2025, I organized a game development hackathon through SoSA ry. During my term as Project and Event Manager, I reached out to the Global Game Jam (GGJ) and worked under the Finnish Game Jam (FGJ) to receive organizational support and guidance. I used Canva to design the marketing materials and an information booklet that contained vital details for participants, such as the theme, submission processes, and required files. Since the theme was "Bubbles," I focused on creating a fun atmosphere that encouraged both digital and analog game creation.

SoSA ry Fresher Guide

Overview

A comprehensive guide with vital information for first-year students majoring in software engineering programs at LUT University's Lahti campus

I collaborated on a comprehensive guide for first-year students to provide them with vital information for their studies. For this project, I provided original photography of locations in Lahti and worked with the SoSA communications personnel to design the booklet on Canva. I wrote the content from my perspective as an international student, focusing on the information I would have wanted to know during my own first year. To ensure the guide remained engaging despite the large amount of information, I used HeyZine to create an interactive digital flipbook and focused heavily on layout design to balance text and photos effectively.

To view the guide, access it via this ink: https://heyzine.com/flip-book/9abd066a9f.html#page/1

SoSA x TiK Halloween Sitz

Overview

A fun, Halloween-themed student event collaborated by SoSA ry and TiK ry, the computer science student association of Aalto University

I helped organize a Halloween-themed student "Sitz" party, which was a collaboration between SoSA ry and TiK ry from Aalto University. In addition to helping with the event organization, I designed the promotional materials and song booklets on Canva. To match the Halloween theme, I utilized a Gothic style with corresponding fonts and a color palette of red and black, which effectively showcased the dark and festive atmosphere of the event.

SoSA ry Network & Chill Excursion

Overview
A networking excursion for SoSA ry members who are interested in meeting local companies and learn responsibilities and required skillsets in the visiting companies

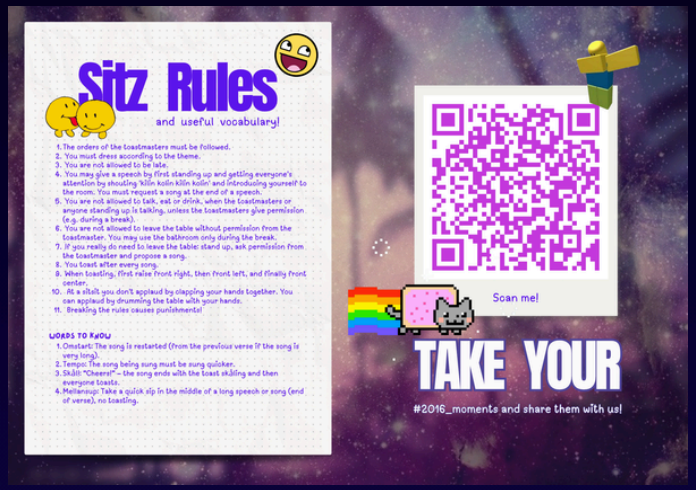
I designed the materials for a networking excursion where SoSA ry members could meet local companies and learn about required professional skillsets. To create a sense of professionalism, I designed the marketing materials in a sleek, minimalist style that aligned with the association's branding guidelines. I also incorporated my own photography into the design to further support the objective of creating a professional and high-quality visual identity for the event.

SoSA ry 2026 Fresher Excursion

Overview

A safari themed excursion organized for LUT University-Lahti-campus' first year software engineering students

With the aim to provide Finnish university students the opportunity to network with the visiting company Nokia and software engineering students of Aalto University, I planned and coordinated this student excursion event in mid-March. To ensure intrigued students understand that the event is a mixture of professionalism and fun, I designed the marketing materials and booklet with safari themed elements while aligning with the association's marketing guidelines.

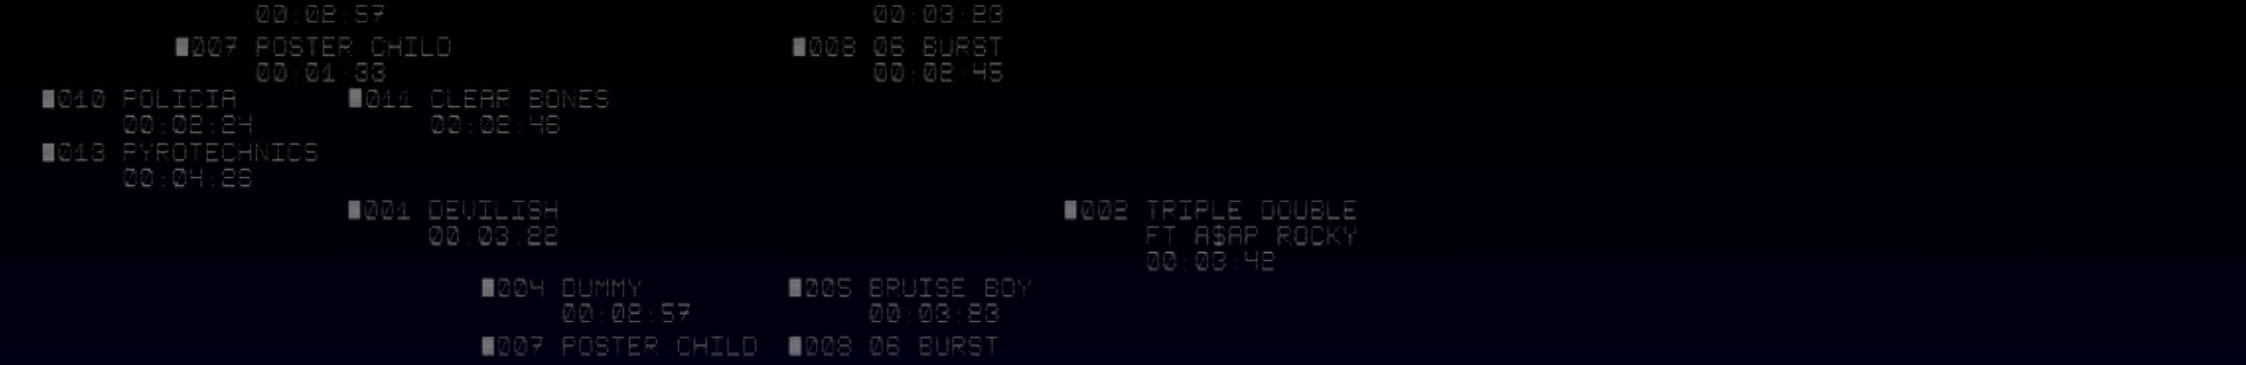


ESN Lahti x SoSA: Bring a Friend Sitz - 2016 Edition

Overview

A collaborated student event between SoSA ry (LUT University-Lahti campus' software engineering student association) and ESN Lahti ry (LUT University-Lahti campus' Erasmus student association)

With the iconic theme 2016, the marketing materials contain globally beloved 2016 Tumblr wallpapers (i.e., purple space galaxy and palm trees), graphic elements, and memes; thus, conveying to the students that the event is social and fun among friends. Being a Bring-A-Friend event type, the photo on the song booklet's cover was selected to align with the event's theme and the design aesthetic.



Thank you
